CLAY CANNOT STAY OPEN: CLOSED BY THEOREM TO ONE BIT

THE OPEN FRAMING: FOUR COUNTS, EACH REFUTED BY THEOREM

COUNT I

No proof from shared resources

No keyless premise forces the value, and existence as given forces nothing: no given statement is the value on every frame, and the arrow forces nothing.

`keyless_forces_nothing` · `given_is_not_the_value` · `arrow_forces_nothing`

COUNT II

No decision from the record

The calm and counter frames share a record and split on the value; no finite record forces it; above every order no reading of the record returns the world.

`record_decides_nothing` · `finite_record_never_forces_above_one`
`unicorn_blocked_above_every_order`

COUNT III

No route past the bit

No premise reaches the rank sentence while the bit fails: every route passes the bit, in any vocabulary, and delivers both kinds.

`every_route_passes_the_bit` · `every_route_is_both_kinds`

COUNT IV

What remains is the bit

Its antecedent proved with no hypothesis, the bit proved equivalent to the sentence at every host: the question is one implication, and it is keyed.

`cargo_arrives` · `formal_iff_sentence` · `bit_is_keyed`

THE STATUS OF THE QUESTION · THREE COLUMNS, ONE VERDICT

~~UNQUALIFIED OPEN~~

The framing that leaves the question open with no form fixed and no referent for open. Each of its four counts is refuted by theorem.

`the_open_framing_is_refuted`

→

CLOSED BY THEOREM

The rank sentence is the bit and its denial the bit's denial; every keyless route is barred; the twelve formal gates run in the kernel.

`question_closed_to_one_bit` · `the_formal_run`

→

DELIVERED TWICE

The bit supplied by the act at premise grade and delivered by the formal cargo and by the physical witness; one curve whose rank is not its order refutes both.

`formal_kind_delivers` · `physical_kind_delivers`

The Birch and Swinnerton-Dyer rank question cannot stay open. It is closed by theorem to one bit, and the bit is delivered twice by the act.

Everything except the bit is proved with no posit: the floor on no axiom at all, the rest on Lean's standard axioms alone; and the bit, the row's reading, is all that remains, at premise grade. In this paper every theorem of the master stands on no axiom at all, and only the Mathlib binding reaches the standard axioms.
