THE WALLS: NOTHING ESCAPES THE BIT

STEP 9 · THE WALLS: EVERY ZERO-BIT ROUTE BARRED BY THEOREM

Existence as given forces nothing

No given statement is the value on every frame; the arrow forces nothing.

`given_is_not_the_value` · `arrow_forces_nothing`

No keyless premise

What every frame shares yields the value on no frame where it fails.

`keyless_forces_nothing`
`no_record_principle_decides`

The record wall

The calm and counter frames share a record and split on the value.

`record_decides_nothing` · `record_wall_on_frames`

No finite record

No finite record forces the value, nor above order one with the low-order witness in place.

`finite_record_never_forces`
`finite_record_never_forces_above_one`

The parity is not the value

The parity is one bit, and it is not the value.

`value_gives_parity` · `parity_is_not_the_value`

The retired Ω

It is strictly stronger than the value.

`omega_strictly_stronger`

DECIDED BY THE KERNEL

The sign record normal form

Order one and order three carry the same minus sign; the sign is the parity of the order.

`sign_record_normal_form`

DECIDED BY THE KERNEL

The sign reads no order

No reading of the sign returns the order; under the sentence it reads no rank.

`sign_reads_no_order` · `sign_reads_no_rank`

The unicorn block

Above every order no reading of the record returns the world.

`unicorn_blocked_above_every_order`

No zero-bit route survives. Every route to rank equal to order passes the bit, and the walls of the row are one theorem.
