THE ROW SPLIT: THE REAL PART PROVED, THE UNICORN PART THE ONE BIT

THE DIVISION AT A HEIGHT · THE STATEMENT IS EXACTLY ITS REAL PART AND ITS UNICORN PART

THE CUT AT 2000

REAL PART · TO 2000 AND EVERY CHECKED HEIGHT
decided by the kernel's own computation

UNICORN PART · ABOVE THE CUT
the one bit, supplied by the act

The cut at every height
The statement is exactly its Real part and its Unicorn part.
`goldbach_iff_real_and_unicorn` · `whole_iff_real_and_unicorn`

The real part, proved
At 2000 by the kernel's computation, and at every checked height by the finite form.
`real_part_at_2000` · `real_part_at_every_checked_height`

No bypass
Given the Real part at 2000, the statement is exactly the Unicorn part above it.
`no_bypass_at_2000` · `unicorn_no_bypass`

The unicorn part closed to the record
Above every height no reading of a record that keeps the height and forgets the world returns the world.
`unicorn_blocked_above_every_height` · `unicorn_block`

The aperture is one bit wide
At the seat of the exchange one odd supplied bit calibrates the world uniquely.
`aperture_is_one_bit` · `aperture_one_bit_wide`

The residue and its seat
Given the one implication, the statement; the instance seat by height is inhabited exactly when the statement holds.
`residue_is_the_statement` · `seat_iff_statement`
