THE WALLS: NOTHING ESCAPES THE BIT

STEP 9 · THE WALLS: EVERY ZERO-BIT ROUTE BARRED BY THEOREM

Existence as given forces nothing
The root, the arrow and the freedom bit hold in both worlds.

`existence_as_given_forces_nothing`
`uniform_premise_forces_nothing`

No keyless premise
What every frame shares yields the value on no frame where it fails.

`keyless_forces_nothing`
`no_record_principle_decides`

The record wall
The calm and counter frames share a record and split on the value.

`record_decides_nothing` · `record_wall`

No finite record
At every height the arithmetic frame truncated there agrees below it, and the value fails.

`finite_arith_record_never_forces`
`finite_record_never_forces`

The certificate stops at its height
The certified region does not reach above its height.

`certificate_does_not_reach_above_arith`

The weaker realizations
The ternary and Chen shapes do not give the binary statement.

`weaker_do_not_give_binary`

DECIDED BY THE KERNEL

The parity normal form
Six primes and six semiprimes share their residues mod 420, with opposite Liouville parity.

`parity_normal_form`

DECIDED BY THE KERNEL

The residue record reads nothing
No reading of the residue mod 420 returns primality or parity on 11 and 851.

`residue_record_decides_nothing`
`residue_record_reads_no_parity`

The unicorn block
Above every height no reading of the record returns the world.

`unicorn_blocked_above_every_height`

No zero-bit route survives. Every route to the Goldbach statement passes the bit, and the walls of the row are one theorem.

READING theorem on no axiom at all · binding theorem on propext (with Quot.sound) · binding theorem on Lean's standard axioms · definition or structure
