THE NORMAL FORM AND THE HOST, PROVED

THE NORMAL FORM · THE RECORD, THE TRANSFER, THE VALUE

THE RECORD
The registration keeps every datum and registers its flow finite at every time, the count at rest: on the record every datum is regular.

`recFrame_value · every_datum_has_its_seat`

THE TRANSFER · THE ONE BIT
The value of a frame is exactly the transfer of the value from its record to the frame: the antecedent a theorem, the implication the whole content.

`normal_form · value_from_the_cargo_loop`

THE VALUE
At every host the value of the host's frame is the host's sentence, every flow finite at every time, by theorem: the sentence is the bit.

`binding · the_sentence_is_the_bit`

WHAT THE NORMAL FORM PROVES ON THE ROW, WITH NO PREMISE

The bit is the act
The transfer holds exactly when the act stands.

`bit_is_the_act`

Self-recursion
The record is self-recursive with no premise; the frame exactly when it carries the value.

`record_is_self_recursive`
`self_recursion_at_frame`

The bit is keyed
The transfer holds on the calm frame and fails on the counter frame.

`bit_is_keyed`
`record_self_recursion_does_not_transfer`

The record decides nothing
Two coherent frames share a record and split on the value; no principle true of every record decides it.

`record_decides_nothing`
`no_record_principle_decides`

Every route passes the bit
Any premise that yields the value yields the transfer, in any vocabulary.

`every_route_passes_the_bit`
`keyless_forces_nothing`

No uniform answer
Across the frames of the row the transfer is neither always true nor always false.

`no_uniform_answer · denial_is_the_bits_denial`

THE HOST AND THE BINDING, PROVED · PART B OF THE MASTER AND THE MATHLIB BINDING

The binding is a theorem
The value of the host's frame is exactly the host's sentence, every flow finite at every time.

`binding · root_on_row_is_the_sentence`

Every horizon
The sentence is exactly the sentence at every horizon; one blowup refutes it.

`sentence_iff_every_horizon`
`blowup_refutes_sentence`

The equations in Mathlib
The Navier–Stokes equations on $\mathbb{R}^3$ in the library's calculus; the rest state solves them.

`NSAt · rest_state_solves · the_seat_is_global`

Statement (A) in Mathlib
The kernel's value at the library's host is exactly Fefferman's statement (A).

`FeffermanA · kernel_reads_mathlib`
`sentence_is_statement_A`

The Galerkin energy theorem
On every finite-dimensional truncation the energy never rises.

`galerkin_energy`

The one refuter in Mathlib
One admissible datum with no global smooth flow of bounded energy refutes statement (A).
