THE NORMAL FORM AND THE HOST, PROVED

THE NORMAL FORM · THE RECORD, THE TRANSFER, THE VALUE

THE RECORD
The registration keeps every manifold and its flow and forgets the state at which it is realized; on the record every manifold starts on the seat.

`recFrame_value` · `every_manifold_has_its_seat`

THE TRANSFER · THE ONE BIT
The value of a frame is exactly the transfer of the value from its record to the frame: the antecedent a theorem, the implication the whole content.

`normal_form` · `value_from_the_cargo_loop`

THE VALUE
At every host the value of the host's frame is the host's sentence, every manifold round, by theorem: the sentence is the bit.

`binding` · `the_sentence_is_the_bit`

WHAT THE NORMAL FORM PROVES ON THE ROW, WITH NO PREMISE

The bit is the act
The transfer holds exactly when the act stands.

`bit_is_the_act`

Self-recursion
The record is self-recursive with no premise; the frame exactly when it carries the value.

`record_is_self_recursive`
`self_recursion_at_frame`

The bit is keyed
The transfer holds on the calm frame and fails on the counter frame.

`bit_is_keyed`
`record_self_recursion_does_not_transfer`

The record decides nothing
Two coherent frames share a record and split on the value; no principle true of every record decides it.

`record_decides_nothing`
`no_record_principle_decides`

Every route passes the bit
Any premise that yields the value yields the transfer, in any vocabulary.

`every_route_passes_the_bit`
`keyless_forces_nothing`

No uniform answer
Across the frames of the row the transfer is neither always true nor always false.

`no_uniform_answer` · `denial_is_the_bits_denial`

THE HOST AND THE BINDING, PROVED · PART B OF THE MASTER AND THE MATHLIB BINDING

The binding is a theorem
The value of the host's frame is exactly the host's sentence, every manifold the round three-sphere.

`binding` · `root_on_row_is_the_sentence`

Registration cannot lie
On a flow faithful to the class, a manifold that comes to rest on the seat is round; the faithful flow's value gives the sentence.

`registered_is_round`
`faithful_value_gives_sentence`

The faithful route is stronger
One round manifold started off the seat never rests: the sentence, not any flow's value, is the bit.

`faithful_route_strictly_stronger`
`faithful_binds`

Bound to Mathlib's statement
PoincareThree is the library's statement; the seat is a closed three-manifold of the library.

`PoincareThree` · `seat_is_a_closed_three_manifold`

The bit is the statement
The transfer at every closed simply connected three-manifold is exactly the library's statement.

`bit_is_the_statement` · `kernel_reads_mathlib`
`statement_iff_hosts`

The generalized statement
At each dimension one equivalence; given every other dimension the whole is exactly dimension three.

`generalized_iff` · `no_bypass_by_dimension`
